

Cloud Infrastructure Storage and Encryption Review

Date: September 2026

Classification: Internal Use Only

1. Active Data Security Stance

Our data protection audit confirms that all production databases and object stores have been successfully migrated away from legacy encryption parameters.

Currently, 100% of internal block storage nodes have completed this migration. The active encryption standard enforced across all cloud infrastructure instances is AES-256 Encryption Keys for data at rest.

2. Active Threat and Vulnerability Index

During our automated system scanning sweep, the security center flagged an active exposure on our public API gateway layer.

* **Threat ID Code:** VULN-2026-8941

* **Severity Tier:** Critical

* **Description & Vulnerability Details:** Remote Code Execution (RCE) via Unvalidated Deserialization in Perimeter APIs. An attacker could potentially inject malicious code fragments via malformed API headers.

* **Current Mitigation Progress:** A software patch has been successfully compiled and deployed to the staging sandbox. The production deployment hotfix is currently pending structural verification loop tests before going live.
