

Q3 Internal Network Infrastructure Audit Report

Date: September 2026

Classification: Internal Use Only

1. Perimeter Edge Firewall Gateway Status

The perimeter edge firewall routers are fully operational and processing traffic under updated security profiles. Deep Packet Inspection (DPI) is actively running on all incoming connections.

2. Port Configuration and Security Vector Matrices

The network engineering team has locked down the external facing nodes to minimize the attack surface.

- * **Port 80 (HTTP):** Enabled. Automatically routes incoming requests through Deep Packet Inspection filters.

- * **Port 443 (HTTPS):** Enabled. Enforces Dynamic TLS v1.3 encryption protocols globally.

- * **Port 22 (SSH):** Blocked completely at the perimeter gateway. Internal access requires an authorized VPN connection.

3. Performance and Latency Tracking Measurements

The system monitored network delays across all edge gateways over the trailing 30 days. The maximum observed edge latency was clocked at 42 ms on the APAC-South Gateway during peak trading hours. All other zones maintained an average latency under 15 ms.
